WORK INTEGRATED LEARNING 3A

TASK 1

Updated Project Plan, Site Map & Wireframes

Spunky's Hairflair Booking System

TEAM NAME: CODING & CURLS

TEAM MEMBERS:

Siphokazi Nofemele – ST10438181
Rethabile Minnaar – ST10441779
Asenathi Valashiya – ST10403979
Given Luna Summerton – ST10434685

LECTURER: Mr Smanga Ngcamu

DUE DATE: 04 September 2026

1. Updated Project Plan

1.1 Project Overview

Spunky's Hairflair is a hair salon based in Mandalay, Mitchell's Plain, offering wash and blow, trim and style, box braids, sew-in weaves, relaxer treatments and full style blowouts. As established in the Task 2 requirement analysis and system design submission, the salon currently manages bookings manually over WhatsApp, which has led to double-bookings, no-shows, lost revenue, and no reliable record of customer history.

The proposed solution is a booking platform, available as both a website and a companion mobile application, that lets customers register, browse services and stylists, select an available date and time, pay a 50% deposit to secure the slot, and manage their own appointments. The project goal remains to reduce no-shows by 80% within three months of launch.

1.2 Objectives and Scope

- Deliver a responsive website (HTML5, CSS3, JavaScript ES6) covering registration, service browsing, stylist selection, date/time booking, deposit calculation, and booking management.
- Deliver a companion mobile application offering the same core functionality in a mobile-first, single-column layout with persistent bottom navigation.
- Keep the scope tightly focused on the booking journey identified in Task 2 — no functionality is added beyond what the requirement analysis specified.
- Ensure both platforms share a consistent visual identity, terminology and data model so customers experience one coherent product regardless of device.

1.3 Team Roles and Deliverable Allocation

Deliverables for Task 1 were allocated across the team as follows. Each member remains responsible for their allocated design artefacts while contributing to review and testing of the others' work.

Team Member	Student Number	Allocated Deliverables
Asenathi Valashiya	ST10403979	Website wireframes (Home, Login/Register, Booking flow); GitHub repository setup, folder structure and README
Siphokazi Nofemele	ST10438181	Updated Project Plan narrative; DevOps lifecycle diagram and tooling write-up
Rethabile Minnaar	ST10441779	Website wireframes (My Bookings, Services, Contact); Site maps (website and mobile) and mobile app wireframes
Given Luna Summerton	ST10434685	Submission checklist and GitHub compliance review; proofreading and formatting of the final report; support across the other deliverables as needed

1.4 Project Timeline

The project follows a short, sprint-based schedule leading up to the Task 1 and Task 2 submissions, aligned to the DevOps lifecycle described in Section 1.5.

Week	Sprint Focus	Key Activities
Week 1	Plan & Design	Confirm scope with lecturer; finalise updated project plan, site maps and wireframes for website and mobile app (Task 1).
Week 2	Core Build	Implement HTML/CSS/JS structure for the website booking flow; set up GitHub repository, branches and README.
Week 3	Feature Complete	Complete booking logic, LocalStorage persistence, validation and responsive styling across the website.
Week 4	Test & Refine	Cross-browser and cross-device testing; peer code review; bug fixes; incorporate lecturer feedback.
Week 5	Documentation & Submission	Finalise requirement analysis and system design documentation; prepare Task 2 submission and GitHub release tag.

1.5 DevOps Lifecycle

The team follows the eight-phase DevOps lifecycle shown in Figure 1 for every feature added to the booking system, from initial planning through to monitoring and feedback that shapes the next sprint. Applying this cycle keeps work visible on GitHub, ensures every change is reviewed before release, and creates a short feedback loop between what is deployed and what is planned next.

Figure 1: DevOps Lifecycle — Spunky's Hairflair Booking System

Phase	What it means for this project
Plan	User stories from the Task 2 requirement analysis are broken into GitHub Issues and assigned to a team member.
Code	HTML5, CSS3 and JavaScript (ES6) are written in VS Code on individual feature branches.
Build	Changes are checked and merged into a develop branch via Pull Request, after review by another team member.
Test	The booking flow, form validation and responsive layout are tested manually across browsers and screen sizes.
Release	An approved Pull Request is merged into main and tagged with a version number and release notes.
Deploy	The website is published automatically via GitHub Pages; a build artefact is produced for the mobile app.
Operate	The live site is used by test customers; bookings persist in LocalStorage (website) or device storage (mobile app).
Monitor	The team reviews commit history, open issues and user feedback to plan the next sprint.

1.6 Tools and Technology Stack

The technology stack carries over the choices already validated in the Task 2 system design, extended with a proposed stack for the mobile application:

Layer	Website	Mobile App
Structure & UI	HTML5, CSS3, Font Awesome icons, Google Fonts (Inter)	Flutter (Dart) — single codebase for iOS and Android, reusing the same visual identity
Logic	JavaScript (ES6)	Dart, mirroring the same registerUser(), selectService(), confirmBooking() style functions
Data Persistence	Browser LocalStorage	On-device local storage (e.g. shared_preferences / sqflite), matching the same Customer, Stylist, Service, Appointment and Payment structure
Version Control & CI	GitHub, GitHub Issues, Pull Requests	Same GitHub repository, monorepo folder structure
Hosting / Distribution	GitHub Pages	Build artefact (APK) shared for testing; app-store packaging out of scope for this module
Design Tools	Figma / draw.io for wireframes and site maps	Figma / draw.io for wireframes and site maps

2. Site Map

The site maps below set out the full page/screen structure for both the website and the mobile app, based directly on the navigation already implemented in the Spunky's Hairflair codebase (index.html) and the requirement analysis submitted for Task 2.

2.1 Website Site Map

Figure 2: Website Site Map

The website is a single-page application gated by a Login/Register modal. Once logged in, the customer reaches the Home page, from which the main navigation bar exposes four sections: Book Now (a four-step flow of Select Service → Select Stylist → Select Date & Time → Booking Summary), My Bookings (view and cancel appointments), Services (the full service catalogue) and Contact (salon details).

2.2 Mobile App Site Map

Figure 3: Mobile App Site Map

The mobile app mirrors the same information architecture, adapted to mobile conventions: a splash screen leads into a one-time Login/Register screen, after which the customer lands on a Home dashboard. A persistent bottom tab bar (Home, Book, My Bookings, Services, Contact) replaces the website's top navigation bar, and the booking journey is presented as a set of step-through screens rather than a single scrolling page.

3. Wireframes

Low-fidelity wireframes for every screen in both site maps are presented below. Website wireframes are laid out as full browser pages; mobile wireframes are presented as phone-sized screens with a persistent bottom tab bar, reflecting the touch-first, single-column conventions of a mobile application.

3.1 Website Wireframes

Home Page & Login/Register Modal

The Home page presents the salon's hero banner and a preview of the service catalogue. A customer who has not yet logged in sees a banner prompting them to log in or register before a booking can begin; doing so opens the Login/Register modal shown alongside it.

Figure 4: Website Wireframe — Home Page & Login/Register Modal

Booking Flow (Book Now)

The booking page walks the customer through a four-step indicator — service, stylist, date and time — while a running Booking Summary panel on the right recalculates the total and 50% deposit as selections are made, ending in a single Confirm Booking action.

Figure 5: Website Wireframe — Booking Flow (Book Now)

My Bookings Page

Returning customers can see every upcoming appointment, its stylist, date, time, deposit and status, with a Cancel action available on each booking card.

Website Wireframe — My Bookings Page

Figure 6: Website Wireframe — My Bookings Page

Services Page & Contact Page

The Services page lists the full catalogue with price, duration and a quick Book action per card. The Contact page presents the salon's address, phone number, email and social media links alongside a location placeholder.

Figure 7: Website Wireframe — Services Page & Contact Page

3.2 Mobile App Wireframes

Login/Register & Home Screen

On first use, the customer registers once with name, email and phone number; on future visits the app remembers them. The Home screen carries the same hero banner and service shortcuts as the website, condensed into a single scrollable column above the persistent tab bar.

Figure 8: Mobile App Wireframe — Login/Register & Home Screen

Booking Flow (step-through screens)

Rather than one long scrolling form, the mobile booking journey is broken into four discrete screens — Select Service, Select Stylist, Date & Time, and Confirm — with a step-dot indicator at the top of each screen so the customer always knows their progress through the flow.

Figure 9: Mobile App Wireframe — Booking Flow (step-through screens)

My Bookings, Services & Contact

The remaining three tabs follow the same card-based pattern as their website equivalents, resized for a single mobile column: appointment cards with a Cancel action, a two-column service grid, and stacked contact detail cards.

Figure 10: Mobile App Wireframe — My Bookings, Services & Contact

Submission Checklist

The items below are drawn directly from the Task 1 brief and are the team's responsibility to action outside this document before the due date:

- Create a new GitHub repository for the project and initialise it with a README file.
- Organise HTML files and other assets in a clear folder structure inside the repository.
- Commit and push project files regularly as progress is made — no zip files are to be submitted.
- Confirm the chosen website idea/functionality with the lecturer before the remainder of the work proceeds, if this has not already been done.
- Submit this report as a Word or PDF document with the required headings in order: Cover Page, Table of Contents, List of Figures, Update Project Plan, Site Map, Wireframes.
